New Delta Location

Roddick Fertilizer

RODDICK FERTILIZER

Roddick Fertilizer has served the agriculture community in Delta, Richmond and Surrey since 1973. Now that we are a division of the Terralink group of companies we are going to bring that customer service experience to the landscape trade in Metro Vancouver. Roddicks has a diverse fleet of vehicles that will perform large or small delivery orders the same day or early the next morning. Our history of agriculture involvement means we understand the time and weather constraints of the Vancouver growing season. Timely delivery of supplies can be the difference of a successful, profitable project and delayed completion leading to overlapping projects and diminished

cash flow.

Beginning February 2 we will also be stocking many of the standard Terralink landscape products at our convenient location in Delta. We will have a great selection of fertilizers, seed and pesticides. Stop in and let our knowledgeable staff provide whatever you need for the whole project or just the finishing touches.

Introducing

Waterwise Lawn Seed

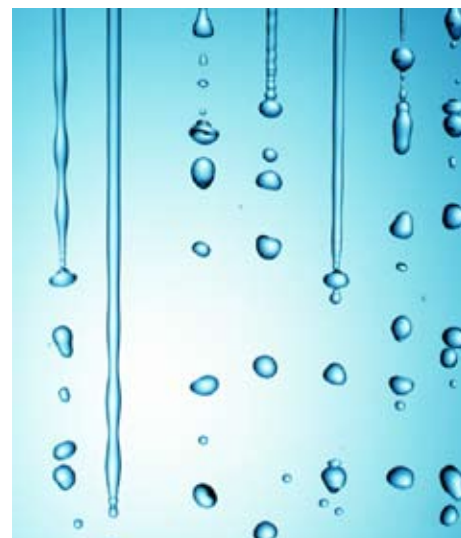

Waterwise Lawn seed is a mixture of four fine fescues for a fine-textured, lush lawn that needs a lot less maintenance than an average lawn. It will grow in both sun and shade and once established, requires less watering and less mowing than a traditional lawn. A wise choice for saving water.

Suggested Seeding Rate: 5-7 lb / 1000 sq.ft.

A **Waterwise** Lawn can thrive under low input conditions due to the characteristics of the fine fescues.

LESS WATERING: The leaves of fine fescue plants are very thin and do not readily

lose moisture to the air and so do not dry out as quickly as other species. Fine fescues also create extensive root systems, which source water and nutrients from the soil better than other turf grasses. As a result, less water (and less nutrients) will be needed once a **Waterwise** Lawn is established.

LESS MOWING: The fine fescues used in a **Waterwise** Lawn have been bred by turf grass scientists to be low-growing. That, coupled with less water and nutrient inputs, results in slower growth/shorter grass and so less mowing is required.
