# SELCOTE ULTRA

Whilst granule dressing of pasture is a proven and effective way to correct stock selenium deficiency, conventional selenium granules can lose as much as 80% of their selenium to the soil. To compensate the granules are applied at a high rate.

High performance SELCOTE ULTRA is different. With SELCOTE ULTRA you only need 0.5 kg/ha to achieve consistent long term deficiency correction.

The SELCOTE ULTRA secret lies in its unique granule shell chemistry and its sophisticated barium selenate/sodium selenate formulation.

The results are obvious. More selenium is available to stock more evenly and over a longer period. You end up using less to achieve a greater and more sustained return.

## One or Two Years Protection

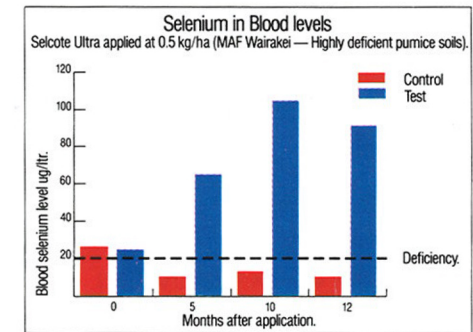

SELCOTE ULTRA's high specification formulation directly relates application rate with length of protection. You need only apply 0.5 kg per hectare for a full 12 month selenium

## The World's First and Only Slow Release High Performance Selenium Granule.

protection. Or you can apply 1 kg per hectare for a full 2 year protection.

Grazing stock may be introduced at any time of the year to pasture treated with SELCOTE ULTRA and they will receive the necessary selenium requirement.

## SELCOTE ULTRA Tenacity

Like other selenium granules SELCOTE ULTRA is fully effective almost immediately.

But, unlike competitive granules that lose effectiveness after the first peak and further applications are required, SELCOTE ULTRA sustains consistent selenium levels, even when new stock is introduced to the pasture.

## SELCOTE ULTRA vs Drenching

Selenium deficiency is a problem with the soil. Drenching, like short term selenium chips, provides an effective short term stock remedy. But it does not correct the root problem, the deficient soil. Only SELCOTE ULTRA provides a sustained, well managed soil correction.

Unlike other granules, SELCOTE ULTRA's slow release formulation means that only 5 grams of selenium per hectare are required for a full 12 months protection. **You save on the time, labour and cost of selenium drenches, bullets and injectables.**

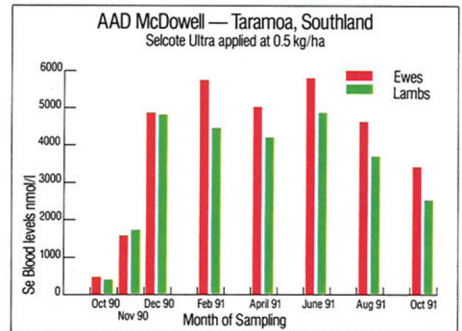

## FLEXIBLE APPLICATION

For 12 months protection treat the entire farm at 0.5 kg per hectare. Alternatively, you can apply 1 kg to alternating halves of the farm on an annual basis or four times the standard rate to 25% of the pasture.

Either way, grazing stock can be introduced at any time of the year and should receive the correct amount of Selenium with appropriate rotational grazing.

## Industry Support

SELCOTE ULTRA has been independently trialed and proven by MAF. It is the accepted market leader and is supported by leading fertiliser companies.
